## DEEP-SKY CHALLENGE OBJECTS by Alan Dyer and Alister Ling

The beauty of the deep sky extends well past the best and brightest objects. The attraction of observing is not the sight of an object itself but our intellectual contact with what it is. A faint, stellar point in Virgo evokes wonder when you try to fathom the depths of this quasar billions of light-years away. The eclectic collection of objects below is designed to introduce some "fringe" catalogs while providing challenging targets for a wide range of apertures. Often more important than sheer aperture are factors such as the quality of sky, quality of the optics, use of an appropriate filter, and the observer's experience. Don't be afraid to tackle some of these with a smaller telescope.

Objects are listed in order of right ascension. Abbreviations are the same as in THE MESSIER CATALOGUE and THE FINEST NGC OBJECTS, with the addition of DN = dark nebula and $\mathrm{Q}=$ quasar. Chart \# indicates the chart in which the object can be found in Uranometria 2000.0 Deep Sky Atlas (2nd Ed., 2001). The last column suggests the minimum aperture, in millimetres, needed to see that object. Most data are taken from Sky Catalogue 2000.0, Vol. 2. Some visual magnitudes are from other sources.

| \# | Object | Con | Type | $\begin{aligned} & \text { RA (2 } \\ & \text { h m } \end{aligned}$ | ) Dec |  | Size | Chart \# | Minimum Aperture mm |
