World Asterisms Project

An Introduction to the Sky Cultures of the World

Volume Two: World Asterism List

Version 2026.8

© Charles Ennis, Sunshine Coast Centre, RASC 2026

World Asterisms List:

This is a list of all the world's asterisms that we've recorded so far (over 20,000) from over 800 sky cultures around the world. Most of the asterisms that I list in this handbook are large-scale asterisms used by everyday people who didn't have access to telescopes. All IAU constellations are listed entirely in **bold** (except for the variations in their name)**.** The telescopic or small-scale asterisms that one would need binoculars or a telescope to view are included in our list, but in the table below just their names are in **bold:** There are over 5,100 of these so far. In some cases, we know the names and certain details of a people's asterism, but not yet where it is in the sky: In these cases, we enter "N/K" in the IAU Constellation column and in the Notes column. In some cases, we know the name of the asterism and the constellation or constellations involved, but not precisely which stars: In these cases, we enter "N/K" in the Notes column. In a few cases we have listed asterisms that where we have not yet identified the original source, and for these we enter General (for "general use") in the Culture column. If you need details on any of the asterisms on this list, please look them up in the companion *World Asterisms Project Handbook* (Volume 1). We're treating the Milky Way as a special asterism and names for the Milky Way are listed in a separate list (Volume 3). If you're interested in where the sky culture is located and/or in finding more information on that sky culture, please refer to the *World Asterisms Project Sky Cultures Resource List* (Volume 4). NOTE: The Sun, Moon, and planets also appear in sky cultures and story lines around the world. We've created a separate handbook (Volume 5) and list (Volume 6) for solar system objects such as the Sun, Moon, and planets.

In this list the "H" column is the hemisphere in which the asterism resides: I've done this to help the reader decide if they can see the asterism from their latitude. For example: If you're in the Northern hemisphere at 49° N where I am, you're not going to be able to see the asterisms in the Southern hemisphere like the Southern Cross. "N" is northern, "S" is southern, and "M" puts you in equatorial regions.

We are using the epoch J2000.0 for the Right Ascension and Declination on this table.

Each entry is under a single subject "view" or "name" for that asterism, so many popular asterisms have multiple entries as each is imagined in a different way: I've done this to clearly demonstrate the many different perspectives involved.
